

Fat32 notes

hexedit is your friend!!

You can mount fat32.img as a real filesystem on Mac or Linux VM

- On Mac, just click the file and finder will mount it.
- On Linux do the following commands

```
sudo mount -o loop fat32.img /mnt
cd /mnt
```

 Once the file is mounted, you can go into the /mnt directory and use all your normal file system commands like ls, cat, cd, etc.

FileSystems are binary structures

- You can't inspect them with a text editor
- You need a hexadecimal file editor, like hexedit.
 - available for Windows, Mac, and Linux
 - displays content in 3 columns: offsets, hex, and ASCII
 - it can modify a file, so be careful!! (Linux hexdump can't modify)

Some FAT Terminology

- Partition = one entire file system
- sector/block = native unit of data on drive
- 2 ways to specify a block
 - CHS = (Old) cluster-head-sector addressing (packed bit fields)
 - LBA = logical block addressing (this is what we use)
- boot sector = first sector of partition
- cluster = group of blocks allocated as one unit
- FAT = file allocation table (linked list)
- FAT and partition meta-data are NOT in clusters!!
- Clusters start after the last FAT table!!

FAT32 Partition Layout

FAT Structure

The File Allocation Table (FAT) is a contiguous number of sectors immediately following the area of reserved sectors. It represents a list of entries that map to each cluster on the volume. Each entry records one of five things:

- the cluster number of the next cluster in a chain
- a special end of cluster-chain (EOC) entry that indicates the end of a chain
 - In FAT32, the EOC is indicated by a value in the range 0x0FFFFFF8 to 0x0FFFFFFF a special entry to mark a bad cluster
 - In FAT32, 0x0FFFFFF7
 a zero to note that the cluster is unused

XXXXXXXX	XXXXXXX	00000009	00000004
00000005	00000007	00000000	80000000
FFFFFFF	0000000A	0000000B	00000011
000000D	000000E	FFFFFFF	00000010
00000012	FFFFFFF	00000013	00000014
	00000016		00000014
		FFFFFFF	

Root Directory:

2, 9, A, B, 11

File #1:

3, 4, 5, 7, 8

File #2:

C, D, E

File #3:

F, 10, 12, 13, 14, 15, 16

FAT Structure

- Because each entry in the FAT table directly corresponds to a comprably positioned cluster on the disk, the math is straightforward to convert:
 - From entry in the FAT table to position on disk
 - From position on disk to entry in the FAT table.

```
XXXXXXXX XXXXXXXX 00000009 00000004
0000005 0000007 00000000
FFFFFFF 0000000A 0000000B 00000011
000000D 000000E FFFFFFF
00000012 FFFFFFF 00000013 00000014
00000015 00000016 FFFFFFF
                          00000000
 Root Directory:
```

2, 9, A, B, 11

File #1:

Important Boot Sector Information

- Size of each region
 - BPB_BytesPerSector
 - BPB_SecPerCluster
 - BPB_RsvdSecCnt
 - BPB_NumFATS
 - BPB_FATSz32
- Root Directory
 - BPB_RootClus
- Warning: this list is not exhaustive

Hex Dump of Boot Sector

of FATs bytes per sector sectors before FAT #1 73 00 00 02 01 20 00 90 6D 6B 64 6F 73 .X.mkdosfs.... 02 00 00 00 00 00 00 00 40 00 00 F8 00 00 20 00 F1 03 00 00 02 00 00 00 00 00 02 00 00 00 00 00 01 00 06 00 00 00100 00 00 00 00 00 00 00100 00

sectors per FAT

cluster # of root directory

Field	Microsoft's Name Offset Size		Value	
Bytes Per Sector	BPB_BytsPerSec	0x0B	16 Bits	Always 512 Bytes
Sectors Per Cluster	BPB_SecPerClus	0x0D	8 Bits	1,2,4,8,16,32,64,128
Number of Reserved Sectors	BPB_RsvdSecCnt	0x0E	16 Bits	Usually 0x20
Number of FATs	BPB_NumFATs	0x10	8 Bits	Always 2
Sectors Per FAT	BPB_FATSz32	0x24	32 Bits	Depends on disk size
Root Directory First Cluster	BPB_RootClus	0x2C	32 Bits	Usually 0x00000002

Finding the Root Directory

- 1. Figure out the *root directory cluster number* from the boot sector, not the FAT (see previous slide)
- 2. Figure out where the root directory starts in the data region
- 3. Read in the root directory structure located at the first sector of the root directory cluster
- 4. Does the root directory span more than 1 cluster?
 Find out by looking up the root directory's **next cluster number** in the FAT.
 - Convert from root cluster to FAT entry
 - Check the FAT entry for the root cluster. FAT will give you
 either the next cluster number in the directory or the *End of*Cluster Chain value (0x0FFFFFF8)
 - If not EoCC, proceed to the next cluster

⁶ Finding Files and Directories

- Each directory is made up of one or more directory
 entries that contain
 - file/subdirectory name (maybe long and short forms)
 - attributes
 - first cluster number
 - more ...

Directory Entries

- List names of files and subdirectories in a directory
- 2 entry types
 - Long-name directory entry (one or more)
 - Starts with 'A' (0x41)
 - precede corresponding short-name directory entry
 - give a file name in Unicode 16-bit-per-character encoding
 - Short-name directory entry
 - limits name size to 8 bytes with 3-byte file extension: ALL CAPS
 - compatibility with previous FAT versions
 - 32 bytes total size
 - other important metadata: attributes, file size, first cluster number, etc.
 - If DIR_Name[0] == 0xE5, then the entry is free (no current file or directory name in this entry)
 - if DIR_Name[0] == 0x00, then the entry is free AND there are no allocated directory entries after this one.

FAT32 Short-Name Directory Layout

Short Name(8+3) Attrib.

Cluster High Cluster Low

Size

32-byte directory layout; short filename version

Name	Offset (byte)	Size (bytes)	Description
DIR_Name	0	11	Short Name
DIR_Attr	11	1	File Attributes (More on it later)
DIR_NTRes	12	1	Reserved for Windows NT
DIR_CrtTimeTenth	13	1	Millisecond stamp at file creation time
DIR_CrtTime	14	2	Time file was created
DIR_CrtDate	16	2	Date file was created

Name	Offset (byte)	Size (bytes)	Description
DIR_LstAccDate	18	2	Last access date
DIR_FstClusHI	20	2	High word of this entry's first cluster number
DIR_WrtTime	22	2	Time of last write
DIR_WrtDate	24	2	Date of last write
DIR_FstClusLO	26	2	Low word of this entry's first cluster number
DIR_FileSize	28	4	32-bit DWORD holding this file's size in bytes

DIR_Attr bit flags:

Bit	7	6	5	4	3	2	1	0
Attribute	Resei Set t		Archive	Directory	Volume ID	System	Hidden	Read- only

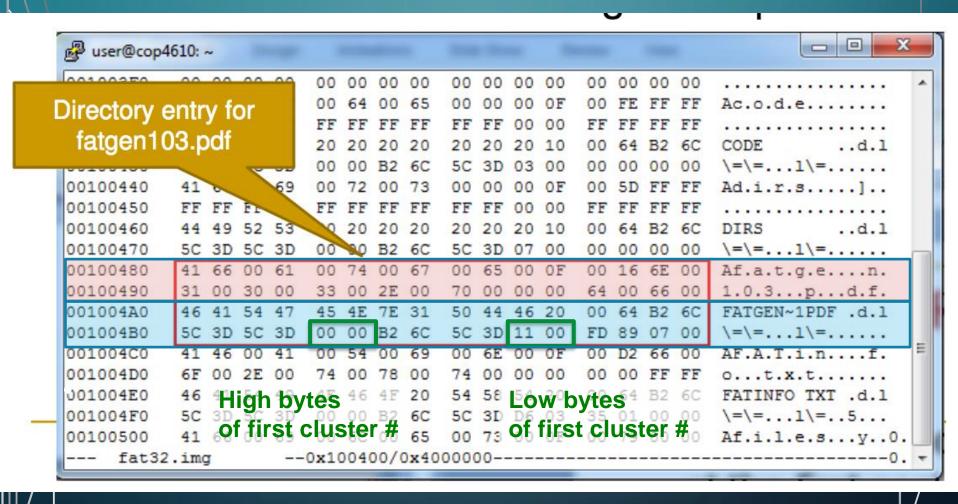

Hex Dump of a Root Directory

- Pink entries are long name entries.
 - Start with "A", low nibble of DIR_Attr is F.
- Blue entries are short-name directory entries

Finding files: Example

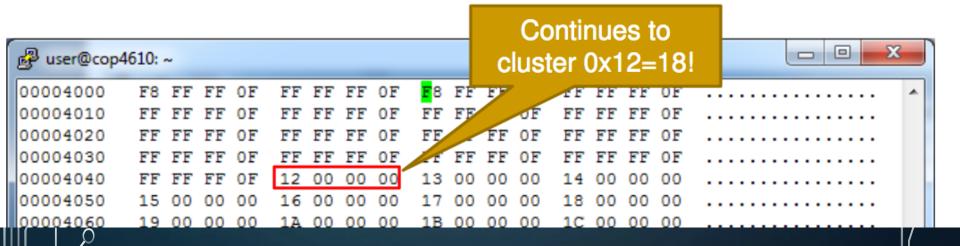

File lives at cluster 0x11. Do math to get the byte address of the beginning of cluster 0x11 and go there...

Does the file continue after this cluster?

Look up cluster 0x11 in the FAT (cluster 17)

What about Sub-directories?

- ATTR_Directory flag is set in the directory entry
- Treated just like a file in terms of cluster allocation
- Clusters contain 32 bytes directory entries for the files and directories under this directory
